

Plesk

How to install Varnish on Plesk 11

This how-to is set to up Varnish on CentOS Plesk 11. The steps listed here are by a 3rd party Plesk repository, or by installing Varnish on your own system.

Installation

- **Important:** Make a backup of your mysql database and all of your content, and change apache's port from 80 to 8080 (or a port of your choosing) in Plesk's

```
sudo local/plesk/admin/bin/httpd.conf -- replace into mis
```

- Change all of the "Listen 80" lines to the new port

```
vim /etc/httpd/conf/httpd.conf
```

- Install Varnish from the Atomic Linux repository, a 3rd party repository, and is highly safe to use as they try to maintain compatibility with

```
yum install -y http://www.atomicorp.com/installers/atomic | sh
```

- Edit /etc/yum/repos/atomic.repo and set enabled to 0, so that you can update

- Edit /etc/sysconfig/varnish and edit these lines:

```
VARNISH_STORAGE_PATH="/var/cache/varnish/${VARNISH_STORAGE_SIZE}"
```

- Change the listen port in the next line to 8080 when Varnish starts

Removal

Removal is fairly simple and straight forward.

- First stop Varnish from listening on port 80 by editing /etc/sysconfig/varnish

```
VARNISH_LISTEN_PORT=80
```

TO

```
VARNISH_LISTEN_PORT=6080
```

- Change the port Apache uses back to 80

```
sudo local/plesk/admin/bin/httpd.conf -- replace into mis
```

- Stop varnish, and restart apache

```
service varnish stop
```

Configuration

~~Please refer to the official Varnish documentation for help on configuring Varnish. <https://www.varnish-cache.org/docs/>~~
An extremely basic varnish config can contain this in /etc/varnish/default.vcl:

```
import std;
{
    backend default {
        .url = "http://192.168.1.4"; # Should be set to the IP your website is listen
    }
}
```
